

PulseGuard Operator Runbook

Date: 2026-07-11

Use this PDF for shift operations, incident response, and escalation handoff.

Shift Start

1. Sign in to dashboard.
2. Check `Fault` and `Warning` counts.
3. Open each faulted machine card.
4. Review anomaly, fault class, and RUL.
5. Confirm all core services are healthy.

Routine Monitoring

- Dashboard: fleet status and high-risk cards.
- Machines: inspect detail and history.
- Sensors: verify assignments and active status.
- AI Models: verify active production models.

Escalate early on repeated fault conditions.

Manual Collection + AI

Run when automatic collection is delayed or after maintenance:

1. Open machine detail.
2. Go to AI Analysis.
3. Run Manual Collection + AI.
4. Validate anomaly, fault class, and RUL outputs.
5. Record a service note.

Service Note Standard

Every note should include:

1. Action performed.
2. Reason for action.
3. Result and current risk.
4. Next follow-up owner and date.

Severity:

- INFO
- WARNING
- CRITICAL

Escalation Criteria

Escalate immediately if:

- Machine status is `FAULT` .
- High-confidence fault persists.
- RUL is at or below site emergency threshold.
- Sensor mapping is invalid and unresolved.

Include machine id, timestamp, and screenshot evidence.

Shift End

1. Ensure all critical notes are logged.
2. Ensure unresolved faults are escalated.
3. Verify model/training states are known.
4. Attach evidence package per site SOP.

Runtime Commands

```
docker compose ps
docker compose logs --tail 200 backend
docker compose logs --tail 200 ml_service
docker compose logs --tail 200 db
docker compose exec db psql -U vibro_user -d vibro_diag -c "SELECT now();"
```

Incident Playbooks

- Login failure: check backend health and auth logs.
- No new AI output: check ML service and rerun manual pipeline.
- Sensor mismatch: correct assignment and log note.
- Model issue: switch to known-good active model and escalate.
